Hazz Karaoke Hoster

v2.30 manual update | Changes since v2.20

Install the complete Windows ZIP

Close your previous copy. Extract v2.30 into a new folder and run **Hazz Karaoke Hoster.exe**. Keep the included **LiveStems** and **Templates** folders beside it. No second engine download is needed.

Browse local tracks

Open **FOLDERS**, expand a drive and select a folder. Filter filenames if needed, then drag a song to a deck. Use Ctrl or Shift to select a batch for music. Karaoke loads the first compatible file. Browsing does not import tracks.

Mix both decks

In two-deck mode, start the first deck, then the second. The second starts muted. Drag the crossfader fully left for Deck 1, fully right for Deck 2, or between them to blend. The silent deck continues playing. Moving the slider takes over from Auto Crossfade. Tick **AUTO CROSSFADE** to restore automation.

Isolate music parts as the track plays

Open **STEMS** while music is playing. Use **Mute** or **Solo** for Vocals, Drums, Bass or Other. Turn on several Solo buttons to hear those parts together. Turn the last Solo off to return to your mute settings. **Restore original** clears both.

Know when stems are ready

The engine runs locally on the CPU and can take several seconds to start. If a stem block is still processing or you seek beyond the ready blocks, the original mix plays until the model catches up. Test one deck first on slower laptops. Separation is an estimate, so some sound may leak between stems.

Playback and scope

Karaoke video preparation now runs in the background. Music and karaoke request more audio buffer headroom, and karaoke waits for sustained clock drift before seeking. AI Automix and beat analysis are not included. Earlier manuals still cover the existing karaoke, singer and library controls.
